2. DETERMINATION OF COLOUR AND pH IN THE GIVEN WATER SAMPLES

AIM

To investigate the colour and pH in the given water samples I, II ,III and thereby determining the quality of water for consumption.

MATERIALS REQUIRED:

- pH paper and colour chart
- Water samples
- Dropper / glass rod
- Test tubes

PRINCIPLE

The colour of water sample ranges from colourless to green and yellowish brown depending upon the planktonic growth and suspended solids.

The pH of a solution is a measure of the concentration of hydrogen ions. The pH value can vary from 0 to 14. Solutions with a pH between 0 and 7 are acidic, while those with a pH between 7 and 14 are basic. pH 7 is considered neutral.

PROCEDURE

- Observe and tabulate the colour of the water samples I , II and III taken in test tubes against a white background.
- Take the three different water solutions in separate test tubes and label them.
- A piece of pH paper is dipped into the sample and compared with that of the colour on the pH chart.
- The approximate pH value of the samples is thus determined and the results tabulated.

OBSERVATION

SL.NO.	SAMPLE	COLOUR OF THE SAMPLE	pH OF THE SAMPLE
1	I		
2	II		
3	II		

INFERENCE

- The pH of the sample _____ is found to be _____. Since it is closer to the neutral pH, it is fit for consumption.

PRECAUTIONS

- Use only the standard colour chart supplied with the pH paper for assessing the pH value.
- Keep the pH strips away from chemicals.
- Either use fresh fine dropper or glass rod for each different sample, or wash the dropper or rod well with water every time.
