C - PRESERVED SPECIMENS

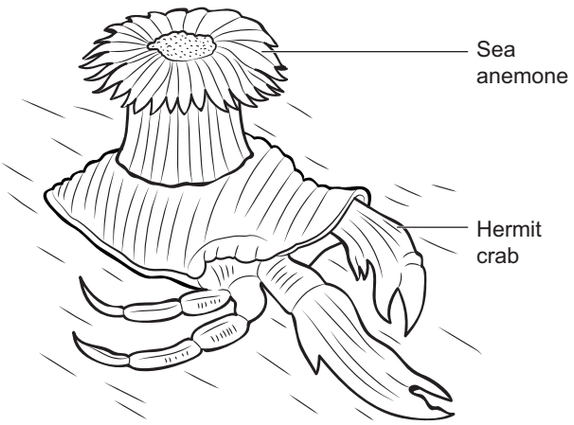

12. MUTUALISM - SEA ANEMONE ON HERMIT CRAB

IDENTIFICATION

The specimen is identified as Sea anemone on hermit crab.

COMMENTS

1. Mutualism is an association of animals where both species are benefited from the interaction.
2. The hermit crab takes shelter on an empty molluscan shell, while the sea anemone (a sedentary coelenterate) grows on the shell.
3. The crab is protected from its enemies by the stinging cells found in the tentacles of sea anemone, whereas the anemone is transported to procure its food.

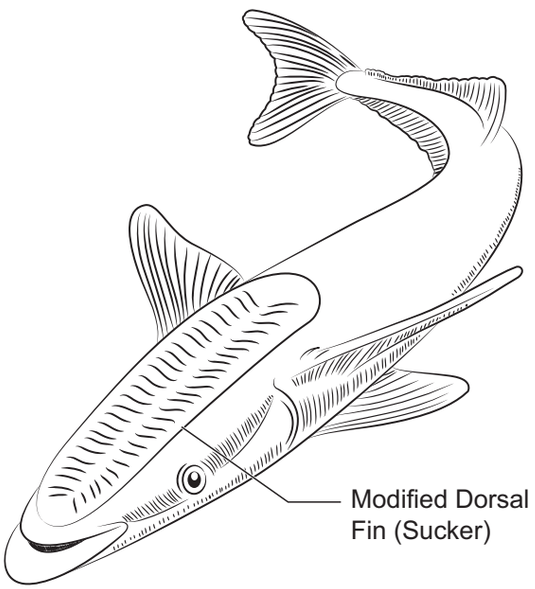

13. COMMENSALISM - SUCKER FISH (ECHENEIS) ON SHARK

IDENTIFICATION

The specimen is identified as sucker fish (ECHENEIS) on shark.

COMMENTS

1. Commensalism is an association of two or more species in which one derives benefit, while other is neither benefited nor harmed.
2. The dorsal fin of suckerfish is modified into a sucker – a sticky gripping structure used to attach to the body of a larger fish such as shark.
3. In this association the fish gets free transport and food while the shark is neither benefited nor harmed in the association.
