16. ANALOGOUS ORGANS

IDENTIFICATION

The given picture is identified as analogous organs.

COMMENTS

1. Organism having different structural patterns but similar function is termed as analogous structure. E.g. Wings of bird and insects (Butterfly, dragon fly).
2. The structures of these animals are not anatomically similar though they perform similar functions.
3. The analogous structures are developed due to convergent evolution – different structures evolving for the same function.

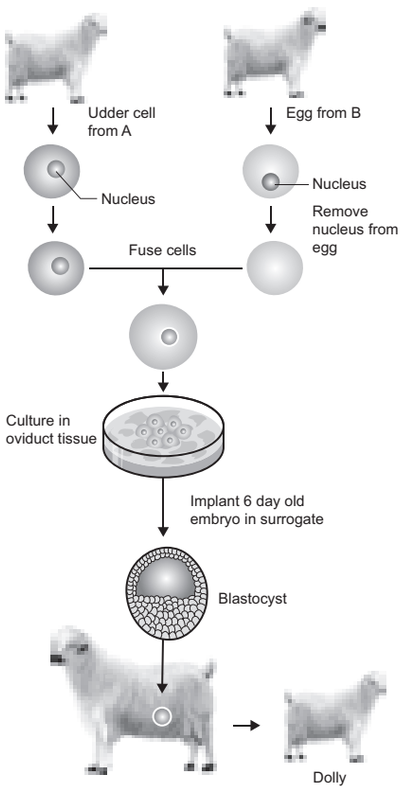

17. ANIMAL CLONING – DOLLY (SHEEP)

IDENTIFICATION

The given picture is identified as cloning of animal – Dolly (Sheep)

COMMENTS

1. Cloning is the process to produce genetically identical individuals of an organism either naturally or artificially.
2. Dolly was the first mammal (sheep) clone developed by Ian Wilmut and Campbell in 1997.
3. Dolly was cloned from a differentiated somatic cell taken from an adult animal without the process of fertilization.
4. In this process, the udder cells (somatic cells) of mammary gland from a donor sheep were isolated. An ovum (egg cell, germ cell) was taken from the ovary of another sheep and enucleated.
5. The udder cell and enucleated ovum were fused and implanted into a surrogate mother. Five months later, dolly was born.
