

Fructose

This shows that a keto group is present in C-2. It also shows that 1^{O} alcoholic groups are present at C- 1 and C- 6. Based on these evidences, the following structure is proposed for fructose (Figure 14-7)

*C- asymmetric carbon

Figure 14.7 Structure of D(+) Fructose

Cyclic structure of fructose

Like glucose, fructose also forms cyclic structure. Unlike glucose it forms a five membered ring similar to furan. Hence it is called furanose form. When fructose is a component of a saccharide as in sucrose, it usually occurs in furanose form.
