(a) If the bottom part of the cloud is 1000 m above the ground, determine the electric potential difference that exists between the cloud and ground.

(b) In a typical lightning phenomenon, around 25 C of electrons are transferred from cloud to ground. How much electrostatic potential energy is transferred to the ground?

Ans: (a) $V = 3 \times 10^9$ V, (b) $U = 75 \times 10^9$ J

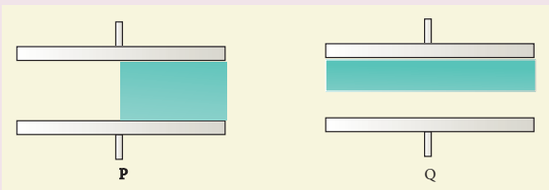

14. For the given capacitor configuration (a) Find the charges on each capacitor (b) potential difference across them (c) energy stored in each capacitor

Ans:

$Q_a = 24\ \mu C$, $Q_b = 18\ \mu C$,
$Q_c = 6\ \mu C$, $Q_d = 24\ \mu C$
$V_a = 3V$, $V_b = 3V$,
$V_c = 3V$, $V_d = 3V$,
$U_a = 36\ \mu J$, $U_b = 27\ \mu J$,
$U_c = 9\ \mu J$, $U_d = 36\ \mu J$

15. Capacitors P and Q have identical cross sectional areas A and separation d. The space between the capacitors is filled with a dielectric of dielectric constant ϵ_r as shown in the figure. Calculate the capacitance of capacitors P and Q.

Ans : $C_P = \frac{\epsilon_o A}{2d}(1+\epsilon_r)$, $C_Q = \frac{2\epsilon_o A}{d}\left(\frac{\epsilon_r}{1+\epsilon_r}\right)$
