PROTEIN METABOLISM

Sir Hans Adolf Krebs

"Krebs, a German-born Jew was trained in medicine and chemistry. When, he was forced out of his position at the University of Freiburg as the Nazis rose to power in the early 1930s, he went to England and joined University of Sheffield in 1935, where he achieved his ground breaking discoveries of TCA cycle and Urea cycle. He was awarded with Nobel prize for his discovery of TCA cycle.

Learning Objectives

After studying this unit the students will be able to

- Understand the general reactions concerned with the catabolism of dietary amino acids
- Comprehend the various ways in which the amino groups of the amino acids are removed
- Reciprocate the removal of carboxyl groups and fate of carbon skeletons of the amino acids
- Emulate (Reproduce) the reactions of Urea cycle and realize that the amino groups of amino acids are removed in the form of urea by liver
- Understand that the amino acids also serve as precursors for many biologically important compounds
