5.6 CEPHALIN

Cephalin is a group of phospholipid compounds, which includes phosphatidyl ethanolamine and phosphatidyl serine. These esters are widely distributed in the body, especially in the brain and spinal cord, and are used as local hemostatic and as reagents in liver function test. They are found abundant in the white matter of the brain and spinal cord.

5.7 ATHEROSCLEROSIS

Atherosclerosis is a disease in which plaque made of fat, cholesterol, calcium found in blood builds up inside the arteries. Over time, this plaque hardens and narrows the arteries, limiting the flow of oxygen-rich blood to various organs. This could lead to various other problems like stroke, heart attack or even death.

Summary

- Lipids (Greek: lipos-fat) are of great importance to the body as the chief concentrated storage form of energy, besides their role in cellular structure and various other biochemical functions.
- They are the concentrated fuel reserve of the body (triacylglycerols).
- Lipids are the constituents of biological membranes and regulate membrane permeability (phospholipids and cholesterol).
