3. Each gene (or group of co-transcribed genes, in bacteria) has its own promoter.
4. Once bound, RNA polymerase separates the DNA strands, providing the single-stranded template needed for transcription.
5. RNA polymerase creates a transcription bubble, which separates the two strands of the DNA helix. This is done by breaking the hydrogen bonds between complementary DNA nucleotides.

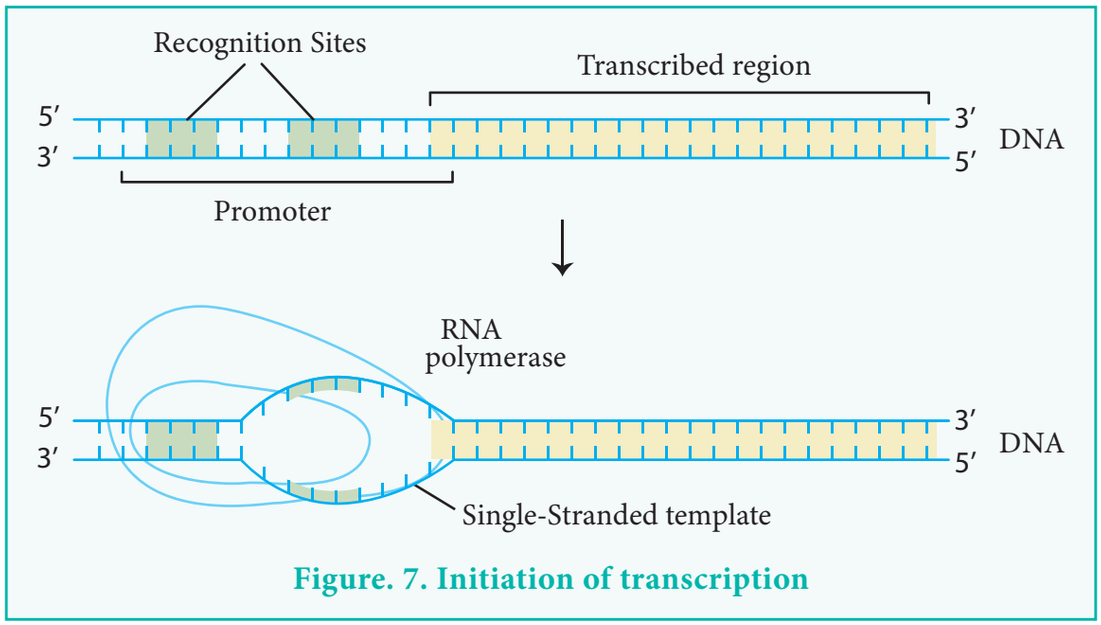

Figure. 7. Initiation of transcription

6.3.2.2 Elongation of transcription

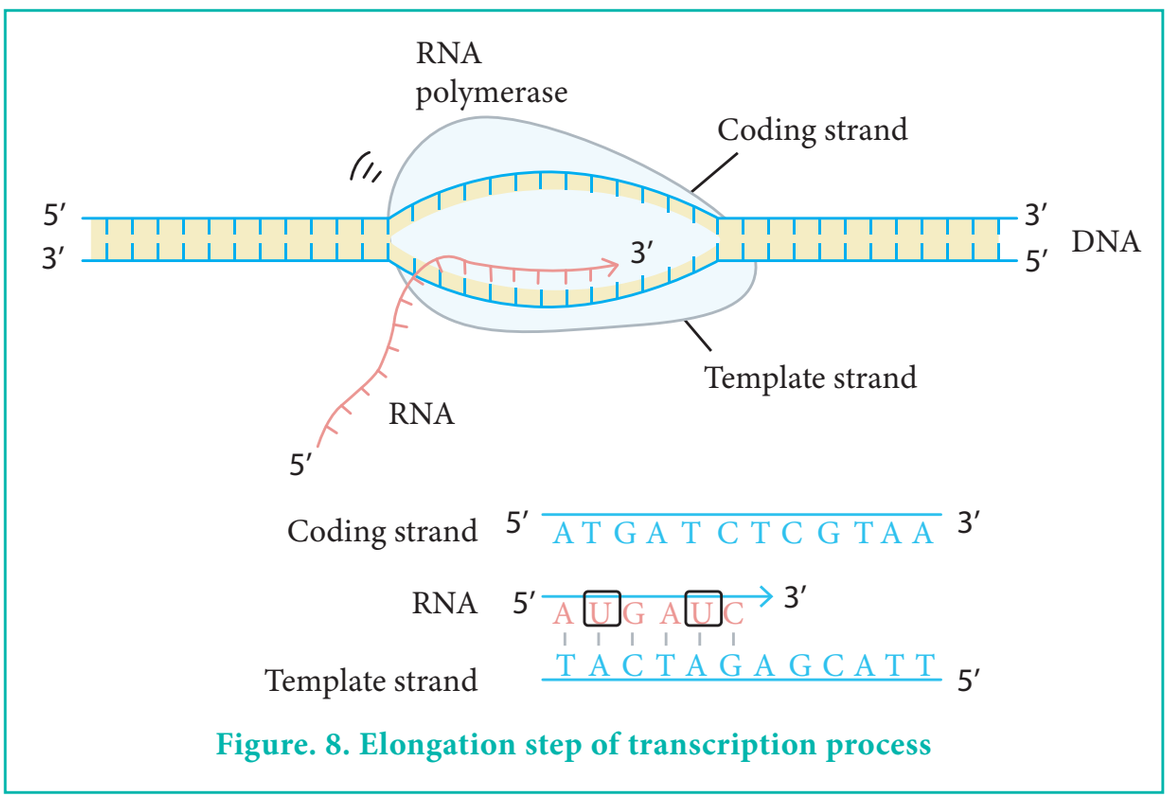

Figure. 8. Elongation step of transcription process
