## Calculation

$T_1$

0.5ml of the test solution corresponds to _____ µg of glucose.

Therefore, 100ml of the test solution will contain = $100 \times \frac{\text{_____ µg of glucose}}{0.5}$

= Z µg of glucose

$T_2$

1.0ml of the test solution corresponds to _____ µg of glucose.

Therefore, 100ml of the test solution will contain = $100 \times \frac{\text{_____ µg of glucose}}{1.0}$

= Z µg of glucose

## Result:

The amount of glucose present in 100ml of the given test solution = _____ µg.
