10ml of 1N sulphuric acid is treated as blank and titrated against potassium permanganate. The end point is the appearance of pale permanent pink colour. Titration is repeated for concordant values and the amount of calcium present is then calculated.

**Tabular Column**

## TITRATION-I

**=Standardisation of Potassium permanganate**

**Standard Oxalic acid Vs Potassium permanganate**

| S. No. | Volume of Oxalic acid(ml) | Burette | | Volume of Potassium Permanganate (ml) | Indicator |
|---|---|---|---|---|---|
| | | Initial (ml) | Final(ml) | | |
| 1. | 10 | 0 | x | x | Self |
| 2. | 10 | 0 | x | | |

Volume of oxalic acid $V_1$ = 10ml

Normality of oxalic acid $N_1$ = 0.1N

Volume of Potassium permanganate = x ml

Normality of potassium permanganate = ?

Normality of potassium permanganate $N_2$ = $\frac{V_1N_1}{V_2}$

= $\frac{10 \times 0.1}{X} = N_2$

= *YN*
