4. Lipids and proteins (integral and peripheral) maintain the structure and function of the membrane
5. Many models have been proposed for the structure of a membrane.
6. The fluid-mosaic model is the widely accepted model that best describes the structures of most of cell membranes
7. Cholesterol and the fatty acids of phospholipids control the fluidity of the membrane.
8. The proteins in the lipid bilayer perform several functions of the membrane. They act as receptors, enzymes, etc.
9. Membrane uses passive and active modes of transport.
10. The endocytotic process and variations of endocytosis allow substances to enter the cell, while exocytosis aids the exit of the substances away from the cell (these process maintain the size of membrane)
11. Membrane is bestowed with properties such as viscosity, surface tension and osmosis thus making them indispensable tool in maintenance of integrity of a cell.
12. Buffers maintain the normal physiological pH. Haemoglobin buffers are playing important role in maintaining pH of blood. The regulatory role of respiratory and renal functions are profoundly dependent on the membranes of lung and kidneys respectively

EVALUATION

I Multiple Choice Questions

1. In a membrane, carbohydrate moieties glycoproteins or glycolipids are

   A. oriented towards outside
   B. placed towards inside
   C. facing towards outside and inside
   D. randomly dispersed (Ans-A)

2. The lipid bilayer _____ in nature

   A. hydrophilic
   B. hydrophobic
   C. both
   D. the nature depends on the immediate environment (Ans-C)

3. _____membrane contains the largest amount of proteins

   A. red blood corpuscular membrane
   B. myelin sheath
   C. lysosomal membrane
   D. outer mitochondrial membrane (Ans-A)
