Infobits

Some Commercial Products of Yeast

Sl. No.	Product	Micro Organism	Uses
1.	Baker's yeast, beer, wine, ale, bread	*Saccharomyces cerevisiae*	Baking industry brewing industry
2.	Soy sauce	*Saccharomyces rouxii*	Food Condiment
3.	Sour French bread	*Candida milleri*	Baking
4.	Commercial alcohol (ethanol)	*Saccharomyces cerevisiae* *Kluyveromyces fragilis*	Fuel, Solvent
5.	Riboflavin	*Eremotherium ashbyi*	Vitamin supplement
6.	Microbial protein	*Candida utilis* *Saccharomyces lipolytica*	Microbial protein from petroleum products. Animal food supplement (single cell protein) from paper-pulp waste

Figure 6.12: Large scale production of SCP

growth of SCP. *Scenedesmus* sp. grows 20 times faster in optimum light than in natural conditions. Optimum temperature and optimum pH is varied according to the strain and intensity of light. Example: *Spirulina* is cultivated at 25–35°C with pH 9.5. Table 6.6 shows different types of microorganisms and substrates used for SCP production.

Pruteen was the 1st commercial SCP used as animal feed additive with 72% of protein. Pruteen was produced from bacteria named *Methylophilus mehylotrophus* cultured on methanol.

In India, National Botanical Research Institute (NBRI) and the Central Food Technological Research Institute (CFTRI) are involved in the production of SCP.

In CPFTRI, SCP is produced from algae cultured on sewage.
