

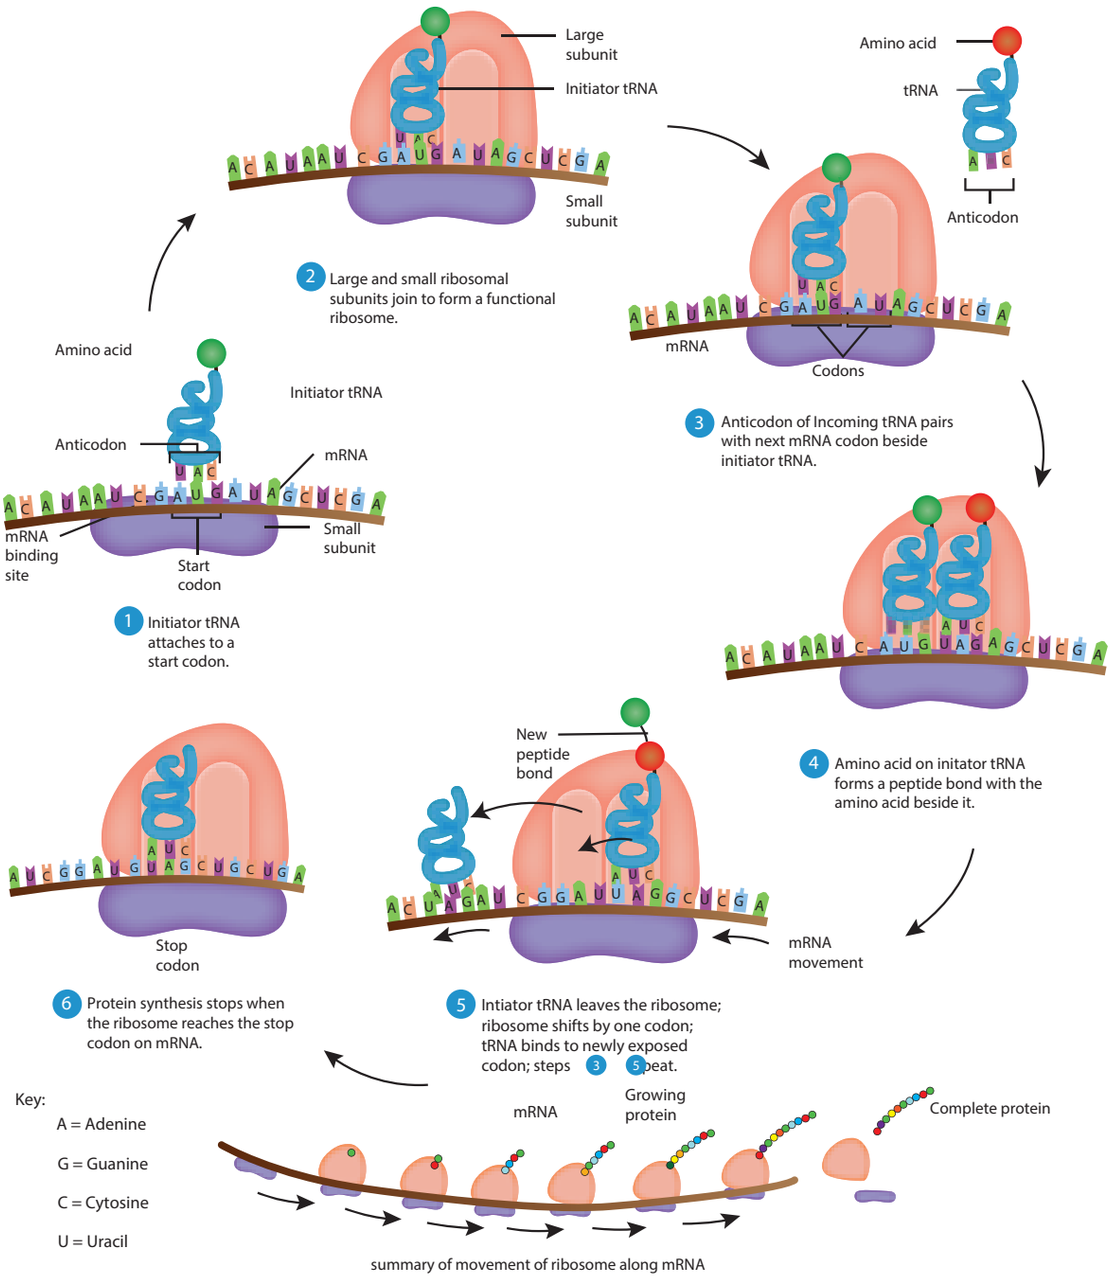

Figure 12.4: Major events in Translation

3. Peptide bonds are made between successively aligned amino acids.
4. Finally the chemical bond between the tRNA and its attached amino acids is broken and the completed protein is removed.

- The 3′ terminal of the tRNA molecule (Figure 12.5) is covalently linked to the amino acid corresponding to the particular mRNA codon
- When an amino acid has become attached to a tRNA molecule, the tRNA is said to be acylated or charged
- An important feature of initiation of polypeptide synthesis in both prokaryotes and eukaryotes is the use of a **specific initiating tRNA molecule**. In prokaryotes this tRNA molecule is acylated with the modified amino acid N – formyl methionine (fMet). This
