Foldscope – origami based paper microscope

A foldscope is an optical microscope that can be assembled from simple components, including a sheet of paper and a lens. It was developed by an Indian Manu Prakash. It consists of the following parts which are as follows: Lens stage, sample stage, panning guide, ramp, lens and magnetic cuppler. It has the magnification of 140X and maximum of 2400X

the surfaces of cells, tissues or particles. The SEM allows viewing the surfaces of specimens without sectioning. The specimen is first fixed in liquid propane at-180°C and then dehydrated in alcohol at-70°C. The dried specimen is then coated with a thin film of heavy metal, such as platinum or gold, by evaporation in a vacuum provides a reflecting surface of electrons. In SEMs, samples are positioned at the bottom of the electron column and the scattered electrons (back-scattered or secondary) are captured by electron detectors.
