Infobits

Major categories and Examples of Fermented Milk Products

Category	Typical Examples
i. Lactic Fermentations	Buttermilk cultured buttermilk Langofil, Tetmjolkymer
Mesophilic	Yogurt, Laban, Zabadi Bulgarian buttermilk
Thermophilic	Bifighurt, Acid ophilur milk, Yakult
Therapeutic	
ii. Yeast-lactic fermentations	Kefir, Koumiss, Acidophilus-yeast milk
iii. Mold – lactic fermentations	Villi

c. Immediately after each, reading, remove and record all the decolourized samples and then gently invert the remaining tubes if the decolourization has not yet begun (Table 5.5).

5.6 Cheese

There are about 2000 varieties of cheese made from mammalian milk. Cheese is thought to have originated in south western Asia some 8000 years ago. The Romans encouraged technical improvements and stimulated the development of new varieties during their invasion in Europe between 60 B.C and A.D. 300. The cheese name is derived from Latin name *caseus* (Figure 5.5).

Figure 5.5: Cheese

They are two groups of cheese, fresh cheese and ripened cheese. The fresh cheese are made up of mild coagulated by acid or high heat example. cottage cheese, while ripened cheese are made through lactic acid bacterial fermentation and coagulated by an enzyme preparation. The curd is removed and salted and whey is separated. The salted curd is held in controlled environment. During this process, various physical and chemical changes occur to give a characteristic flavour and texture. So the mammalian origin of milk influences the flavour and aroma of a natural ripened cheese.

Microbiology of cheese

A large number of microorganisms plays a role in the ripening process. On the first day of cheese making process, the microbial number in the starting material ranges from one to two billion. Therefore, the production declines because of insufficient oxygen, high acidity and the presence of inhibitory compounds that are produced as the cheese ripens. It is mainly the action of
