31. Highlight the milestones from the history of plant embryology.
32. Discuss the importance of Modern methods in reproduction of plants.
33. What is Cantharophily.
34. List any two strategy adopted by bisexual flowers to prevent self-pollination.
35. What is endothelium.
36. "The endosperm of angiosperm is different from gymnosperm". Do you agree. Justify your answer.
37. Define the term Diplospory.
38. What is polyembryony. How it can commercially exploited.
39. Why does the zygote divides only after the division of Primary endosperm cell.
40. What is Mellitophily?
41. "Endothecium is associated with dehiscence of anther" Justify the statement.
42. List out the functions of tapetum.
43. Write short note on Pollen kitt.
44. Distinguish tenuinucellate and crassinucellate ovules.
45. 'Pollination in Gymnosperms is different from Angiosperms' – Give reasons.
46. Write short note on Heterostyly.
47. Enumerate the characteristic features of Entomophilous flowers
48. Discuss the steps involved in Microsporogenesis.
49. With a suitable diagram explain the structure of an ovule.
50. Give a concise account on steps involved in fertilization of an angiosperm plant.
51. What is endosperm. Explain the types.
52. Differentiate the structure of Dicot and Monocot seed.
53. Give a detailed account on parthenocarpy. Add a note on its significance.

Glossary

Apospory: The process of embryo sac formation from diploid cells of nucellus as a result of mitosis

Budding: A method of asexual reproduction where small outgrowth(Bud) from a parent cell are produced

Callus: Undifferentiated mass of cells obtained through tissue culture.

Clone: Genetically identical individuals.

Endothecium: A single layer of hygroscopic, radially elongated cells found below the epidermis of anther which helps in dehiscence of anther.

Fertilization: The act of fusion of male and female gamete

Grafting: Conventional method of reproduction where stock and scion are joined to produce new plant.

Horticulture: Branch of plant science that deals with the art of growing fruits, vegetables, flowers and ornamental plants.

Nucellus: The diploid tissue found on the inner part of ovule next to the integuments.

Pollenkitt: A sticky covering found on the surface of the pollen that helps to attract insects.

Regeneration: Ability of organisms to replace or restore the lost parts.

Sporopollenin: Pollen wall material derived from carotenoids and is resistant to physical and biological decomposition.

Tapetum: Nutritive tissue for the developing sporogenous tissue

Transmitting tissue: A single layer of glandular canal cells lining the inner part of style.
